## Lab 2

1. 提交作業之前，建議可以先點選上方工具列的**Kernel**，再選擇**Restart & Run All**，檢查一下是否程式跑起來都沒有問題，最後記得儲存。
2. 請先填上下方的姓名(name)及學號(student\_id)再開始作答，例如：

```
name = "我的名字"
student_id= "B06201000"
```

3. 四個求根演算法的實作可以參考[lab-2 \(https://yuanyuyuan.github.io/itcm/lab-2.html\)](https://yuanyuyuan.github.io/itcm/lab-2.html)，裡面有教學影片也有範例程式可以套用。
4. **Deadline: 10/9(Wed.)**

In [1]:

```
name = "歐陽秉志"
student_id = "B05201012"
```

## Exercise 1 - Bisection

Use the bisection method to find roots of

$$f(x) = \cosh(x) + \cos(x) - c, \text{ for } c = 1, 2, 3,$$

### Import libraries

In [2]:

```
import matplotlib.pyplot as plt
import numpy as np
```

**1. Define a function  $g(c)(x) = f(x) = \cosh(x) + \cos(x) - c$  with parameter  $c = 1, 2, 3$ .**

In [3]:

```
def g(c):
    assert c == 1 or c == 2 or c == 3
    def f(x):
        return np.cosh(x) + np.cos(x) - c
    return f
```

(Top)

Pass the following assertion.

In [4]:

cell-b59c94b754b1fc9e

(Top)

```
assert g(1)(0) == np.cosh(0) + np.cos(0) - 1
### BEGIN HIDDEN TESTS
assert g(2)(0) == np.cosh(0) + np.cos(0) - 2
assert g(3)(0) == np.cosh(0) + np.cos(0) - 3
### END HIDDEN TESTS
```

## 2. Implement the algorithm

In [5]:

(Top)

```

def bisection(
    func,
    interval,
    max_iterations=5,
    tolerance=1e-7,
    report_history=False,
):
    """
    Parameters
    -----
    func : function
        The target function
    interval: list
        The initial interval to search
    max_iterations: int
        One of the termination conditions. The amount of iterations allowed.
    tolerance: float
        One of the termination conditions. Error tolerance.
    report_history: bool
        Whether to return history.
    Returns
    -----
    result: float
        Approximation of the root.
    history: dict
        Return history of the solving process if report_history is True.
    """
    a, b = interval
    assert func(a) * func(b) < 0, 'This initial interval does not satisfied the prerequisites!'
    num_iter = 0

    a_next, b_next = a, b

    # history
    if report_history:
        history = {'estimation': [], 'error': []}

    while True:
        c = (a_next + b_next) / 2 # mid pt
        error = (b_next - a_next) / 2 # error

        if report_history:
            history['estimation'].append(c)
            history['error'].append(error)

        if error < tolerance:
            print("The approxiamtion has satisfied the tolerance (error: {}).".format(error))
            return (c, history) if report_history else c

        if num_iter < max_iterations:
            num_iter += 1

            fc = func(c)
            if func(a_next) * fc < 0:
                a_next = a_next
                b_next = c
            elif fc * func(b_next) < 0:
                a_next = c
                b_next = b_next
            else:
                return c

        else:
            print("max iterations reached.")
            return (c, history) if report_history else c

    # =====

```

Test your implementation with the assertion below.

In [6]:

cell-4d88293f2527c82d

(Top)

```
root = bisection(lambda x: x**2 - x - 1, [1.0, 2.0], max_iterations=100, tolerance=1e-7, report_history=F
alse)
assert abs(root - ((1 + np.sqrt(5)) / 2)) < 1e-7
```

The approxiamtion has satisfied the tolerance (error: 5.960464477539063e-08)

### 3. Answer the following questions under the case $c = 1$ .

**Plot the function to find an interval that contains the zero of  $f$  if possible.**

In [7]:

(Top)

```
c = 1
f = g(c)
search_range = np.arange(-2.0, 2.0, 0.001)
# =====

fig, ax = plt.subplots(figsize=(9, 4))
ax.plot(search_range, f(search_range))
ax.set_title(r'$f(x)=\cosh(x)+\cos(x)-c$, $c=${d}' % c)
ax.grid(True)
ax.axhline(y=0)
ax.axvline(x=0)
plt.show()
```

**According to the figure above, estimate the zero of  $f$ .**

**For example,**

```
root = 3      # 單根
root = -2, 1  # 多根
root = None   # 無解
```

In [8]:

(Top)

```
# Hint: root = ?
root = None
```

In [9]:

cell-d872c7c57f11c968

(Top)

```
print('My estimation of root:', root)
### BEGIN HIDDEN TESTS
if root == None:
    print('Right answer!')
else:
    raise AssertionError('Wrong answer!')
### END HIDDEN TESTS
```

My estimation of root: None  
Right answer!

**Try to find the zero with a tolerance of  $10^{-10}$ . If it works, plot the error and estimation of each step. Otherwise, state the reason why the method failed on this case.**

(Top)

```
root = bisection(g(c), [-1.0, 1.0], max_iterations=100, tolerance=1e-10, report_history=False)
```

the estimation failed since the function  $\cosh(x) + \cos(x) - 1$  is always positive. It is not possible to find an interval  $[a, b]$

s.t.  $f(a) * f(b) < 0$

**4. Answer the following questions under the case  $c = 2$ .**

**Plot the function to find an interval that contains the zero of  $f$  if possible.**

In [10]:

(Top)

```
c = 2
f = g(c)
search_range = np.arange(-0.1, 0.1, 0.0001)
# =====

fig, ax = plt.subplots(figsize=(9, 4))
ax.plot(search_range, f(search_range))
ax.set_title(r'$f(x)=\cosh(x)+\cos(x)-c$, $c=${d}' % c)
ax.grid(True)
ax.axhline(y=0)
ax.axvline(x=0)
plt.show()
```

According to the figure above, estimate the zero of  $f$ .

For example,

```
root = 3          # 單根
root = -2, 1      # 多根
root = None       # 無解
```

In [11]:

cell-20fddbe6fa4c437b (Top)

```
# Hint: root = ?
root = 0
```

In [12]:

cell-20fddbe6fa4c437b (Top)

```
print('My estimation of root:', root)

### BEGIN HIDDEN TESTS
assert type(root) is float or int, 'Wrong type!'
### END HIDDEN TESTS
```

My estimation of root: 0

Try to find the zero with a tolerance of  $10^{-10}$ . If it works, plot the error and estimation of each step. Otherwise, state the reason why the method failed on this case.

In [13]:

```
root = bisection(g(c), [-1.0, 1.0], max_iterations=100, tolerance=1e-10, report_history=False)
```

```
-----
AssertionError                                Traceback (most recent call last)
<ipython-input-13-144444bdf18e> in <module>

--> 29     assert func(a) * func(b) < 0, 'This initial interval does not satisfied the prere
quisites!'
    30     num_iter = 0
    31

AssertionError: This initial interval does not satisfied the prerequisites!
```

(Top)

```
the estimation failed since the function  $\cosh(x) + \cos(x) - 2$  is always greater than or equal to 0. It is not possible to find an interval  $[a, b]$ 

s.t.  $f(a) * f(b) < 0$ 
```

5. Answer the following questions under the case  $c = 3$ .

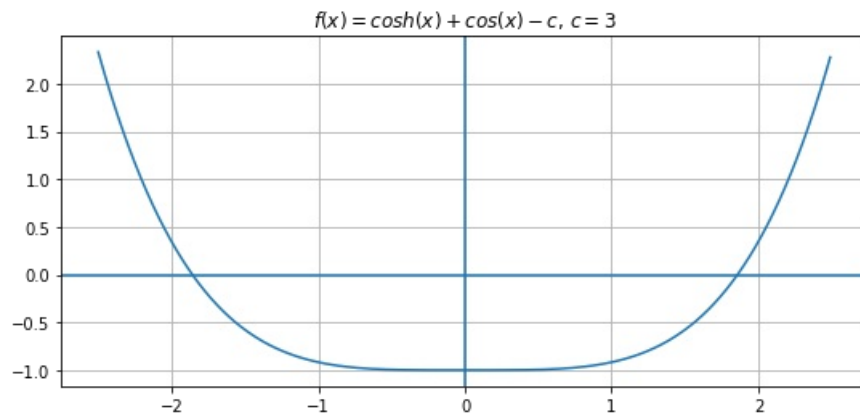

Plot the function to find an interval that contains the zeros of  $f$  if possible.

In [14]:

(Top)

```
c = 3
f = g(c)
search_range = np.arange(-2.5, 2.5, 0.01)
# =====

fig, ax = plt.subplots(figsize=(9, 4))
ax.plot(search_range, f(search_range))
ax.set_title(r'$f(x)=\cosh(x)+\cos(x)-c$, $c=${d}' % c)
ax.grid(True)
ax.axhline(y=0)
ax.axvline(x=0)
plt.show()
```

According to the figure above, estimate the zero of  $f$ .

For example,

```
root = 3      # 單根
root = -2, 1   # 多根
root = None    # 無解
```

In [15]:

(Top)

```
# Hint: root = ?
root = -1.8, 1.8
```

In [16]:

cell-06ec0b20844075c7

(Top)

```
print('My estimation of root:', root)

### BEGIN HIDDEN TESTS
assert type(root) == tuple, 'Should be multiple roots!'
### END HIDDEN TESTS
```

My estimation of root: (-1.8, 1.8)

Try to find the zero with a tolerance of  $10^{-10}$ . If it works, plot the error and estimation of each step. Otherwise, state the reason why the method failed on this case.

In [17]:

(Top)

```
root1 = bisection(g(c), [-2, 0], max_iterations=100, tolerance=1e-10, report_history=True)
root2 = bisection(g(c), [0, 2], max_iterations=100, tolerance=1e-10, report_history=True)
print("The roots are {} and {}".format(root1[0], root2[0]))
```

The approximation has satisfied the tolerance (error: 5.820766091346741e-11)  
The approximation has satisfied the tolerance (error: 5.820766091346741e-11)  
The roots are -1.8579208291484974 and 1.8579208291484974.

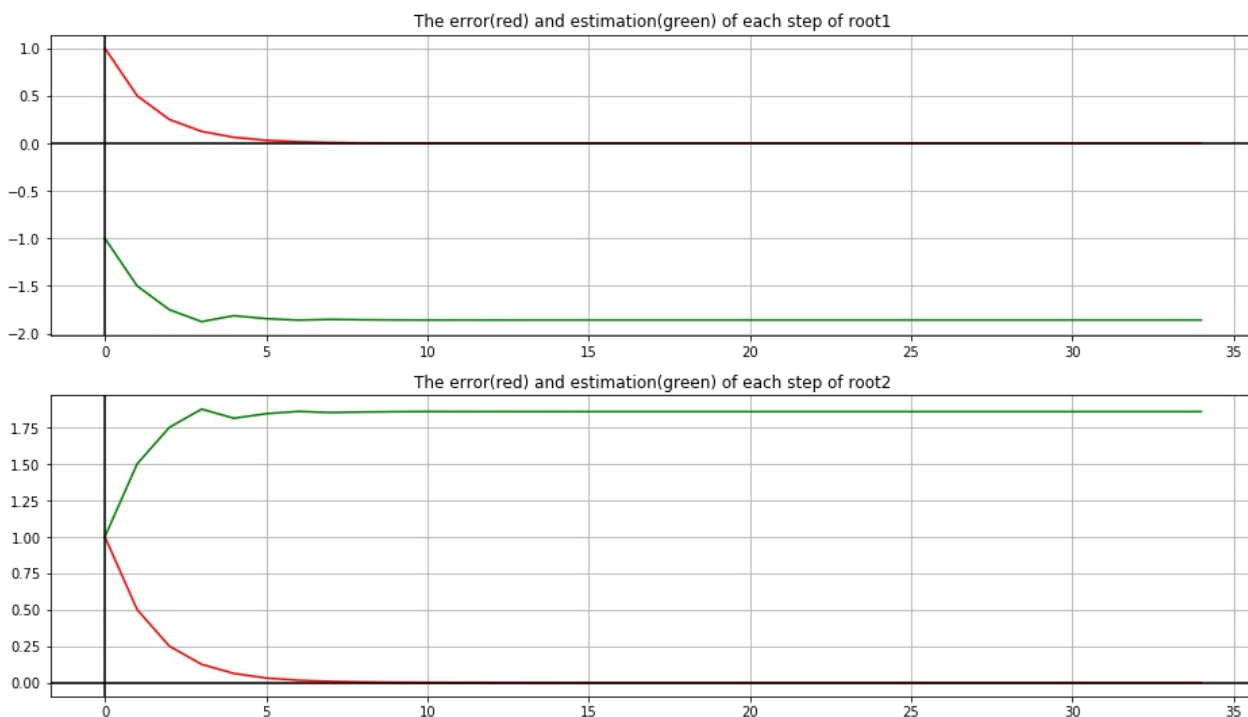

In [18]:

```
fig, axes = plt.subplots(2, 1, figsize=(16, 9))
ax1, ax2 = axes

ax1.plot(range(len(root1[1]['error'])), root1[1]['error'], 'r')
ax1.plot(range(len(root1[1]['estimation'])), root1[1]['estimation'], 'g')
ax1.set_title("The error(red) and estimation(green) of each step of root1")
ax1.grid(True)
ax1.axhline(y=0, color='k')
ax1.axvline(x=0, color='k')

ax2.plot(range(len(root2[1]['error'])), root2[1]['error'], 'r')
ax2.plot(range(len(root2[1]['estimation'])), root2[1]['estimation'], 'g')
ax2.set_title("The error(red) and estimation(green) of each step of root2")
ax2.grid(True)
ax2.axhline(y=0, color='k')
ax2.axvline(x=0, color='k')

plt.show()
```

## Discussion

**For all cases above(c=1,2,3), do the results(e.g. error behaviors, estimations, etc) agree with the theoretical analysis?**

$c=1$  時函數恆為正，沒有根

$c=2$  時只有在原點處函數等於0，其他地方都大於0，無法用此方法求解  $c=3$  的情況有兩個根，所以各自給相對應的區間  $[-2, 0]$ ,  $[0, 2]$ 。

根據

$$|error| < \frac{|b-a|}{2^{n+1}} \implies 10^{-10} < \frac{2}{2^{n+1}} \implies n > \log_2(10^{10}) \implies n \geq 34.$$

In [19]:

```
np.log(10**10)/np.log(2)
```

Out[19]:

```
33.219280948873624
```

In [20]:

```
print(len(root1[1]['estimation']))
print(len(root2[1]['estimation']))
```

```
35
```

```
35
```

In [21]:

```
