## Lab 4

1. 提交作業之前，建議可以先點選上方工具列的**Kernel**，再選擇**Restart & Run All**，檢查一下是否程式跑起來都沒有問題，最後記得儲存。
2. 請先填上下方的姓名(name)及學號(student\_id)再開始作答，例如：

```
name = "我的名字"  
student_id= "B06201000"
```

3. 演算法的實作可以參考[lab-4 \(https://yuanyuyuan.github.io/itcm/lab-4.html\)](https://yuanyuyuan.github.io/itcm/lab-4.html), 有任何問題歡迎找助教詢問。
4. **Deadline: 11/20(Wed.)**

In [1]:

```
name = "歐陽秉志"  
student_id = "B05201012"
```

## Exercise 2

Let  $I(f)$  be a define integral defined by

$$I(f) = \int_0^1 f(x) dx,$$

and consider the quadrature formula

$$\hat{I}(f) = \alpha_1 f(0) + \alpha_2 f(1) + \alpha_3 f'(0) \quad (*)$$

for approximation of  $I(f)$ .

Part 1.

Determine the coefficients  $\alpha_j$  for  $j = 1, 2, 3$  in such a way that  $\hat{I}$  has the degree of exactness  $r = 2$ . Here the degree of exactness  $r$  is to find  $r$  such that

$$\hat{I}(x^k) = I(x^k) \quad \text{for } k = 0, 1, \dots, r \quad \text{and} \quad \hat{I}(x^j) \neq I(x^j) \quad \text{for } j > r,$$

where  $x^j$  denote the  $j$ -th power of  $x$ .

(Top)

Derive the values of  $\alpha_1, \alpha_2, \alpha_3$  in ( \* ). You need to write down the detail in the cell below with Markdown/LaTeX.

We have

$$\begin{cases} I(1) = 1 \\ I(x) = 1/2 \\ I(x^2) = 1/3 \end{cases} \text{ Also, } \begin{cases} \hat{I}(1) = \alpha_1 + \alpha_2 \\ \hat{I}(x) = \alpha_2 + \alpha_3 \\ \hat{I}(x^2) = \alpha_2 \end{cases} \text{ So, } \begin{cases} \alpha_1 = \frac{2}{3} \\ \alpha_2 = \frac{1}{3} \\ \alpha_3 = \frac{1}{6} \end{cases}$$

Fill in the tuple variable `alpha_1` , `alpha_2` , `alpha_3` with your answer above.

In [2]:

(Top)

```
'''Hint:
alpha_1 = ?
alpha_2 = ?
alpha_3 = ?
'''
# ===== 請實做程式 =====
alpha_1=2/3
alpha_2=1/3
alpha_3=1/6
# =====
```

In [3]:

(Top)

part\_1

```
print("alpha_1 =", alpha_1)
print("alpha_2 =", alpha_2)
print("alpha_3 =", alpha_3)
### BEGIN HIDDEN TESTS
assert abs(alpha_1 - 2/3) <= 1e-7, 'alpha_1 is wrong!'
assert abs(alpha_2 - 1/3) <= 1e-7, 'alpha_2 is wrong!'
assert abs(alpha_3 - 1/6) <= 1e-7, 'alpha_3 is wrong!'
### END HIDDEN TESTS
```

```
alpha_1 = 0.6666666666666666
alpha_2 = 0.3333333333333333
alpha_3 = 0.16666666666666666
```

**Part 2.**

Find an appropriate expression for the error  $E(f) = I(f) - \hat{I}(f)$ , and write your process in the below cell with Markdown/LaTeX.

$$E(f) = I(f) - \hat{I}(f) = \int_0^1 f(x) dx - \frac{2}{3}f(0) - \frac{1}{3}\alpha_2 f(1) - \frac{1}{6}\alpha_3 f'(0)$$

**Part 3.**

Compute

$$\int_0^1 e^{-\frac{x^2}{2}} dx$$

using quadrature formulas ( \* ), the Simpson's rule and the Gauss-Legendre formula in the case  $n = 1$ . Compare the obtained results.

**Part 3.1**

Import necessary libraries

In [4]:

```
import numpy as np
import matplotlib.pyplot as plt
from scipy.special.orthogonal import p_roots
```

**Part 3.2**

Define the function  $f(x) = e^{-\frac{x^2}{2}}$  and its derivative.

In [5]:

```
def f(x):
    # ===== 請實做程式 =====
    return np.e**(-x**2/2)
    # =====
def d_f(x):
    # ===== 請實做程式 =====
    return -x*f(x)
    # =====
```

Print and check your functions.

In [6]:

part\_3\_1\_1

(Top)

```
print('f(0) =', f(0))
print("f'(0) =", d_f(0))
### BEGIN HIDDEN TESTS
assert abs(f(5) - np.exp(-5**2/2)) <= 1e-7, 'f(5) is wrong!'
assert abs(f(10) - np.exp(-10**2/2)) <= 1e-7, 'f(10) is wrong!'
assert abs(d_f(5) - -5*np.exp(-5**2/2)) <= 1e-7, "f'(5) is wrong!"
assert abs(d_f(10) - -10*np.exp(-10**2/2)) <= 1e-7, "f'(10) is wrong!"
### END HIDDEN TESTS
```

```
f(0) = 1.0
f'(0) = 0.0
```

## Part 3.3

Compute

$$\int_0^1 e^{-\frac{x^2}{2}} dx$$

with the formula (\*).

Fill your answer into the variable `approximation`.

In [7]:

(Top)

```
# Hint: approximation = ...
# ===== 請實做程式 =====
approximation = alpha_1*f(0) + alpha_2 * f(1) + alpha_3 * d_f(0)
# =====
```

Run and check your answer.

In [8]:

part\_3\_2

(Top)

```
print("The result of the integral is", approximation)
### BEGIN HIDDEN TESTS
assert abs(approximation - 0.8688435532375445) < 1e-3, "wrong approximation!"
### END HIDDEN TESTS
```

The result of the integral is 0.8688435532375445

## Part 3.4

Compute

$$\int_0^1 e^{-\frac{x^2}{2}} dx$$

with Simpson's rule.

Implement Simpson's rule

In [9]:

(Top)

```
def simpson(
    f,
    a,
    b,
    N=50
):
    ...
    Parameters
    -----
    f : function
        Vectorized function of a single variable
    a , b : numbers
        Interval of integration [a,b]
    N : (even) integer
        Number of subintervals of [a,b]
    Returns
    -----
    S : float
        Approximation of the integral of f(x) from a to b using
        Simpson's rule with N subintervals of equal length.
    ...
    # ===== 請實做程式 =====
    delta = (b-a)/N
    S = 0
    for i in range(1, N//2+1):
        S += f(a+(2*i-2)*delta) + 4*f(a+(2*i-1)*delta) + f(a+(2*i)*delta)
    S *= delta/3
    return S
    # =====
```

Run and check your function.

In [10]:

(Top)

simpson

```
S = simpson(f, 0, 1, N=50)
print("The result from Simpson's rule is", S)
### BEGIN HIDDEN TESTS
assert abs(S - 0.8556243929705796) < 1e-7, "Wrong answer!"
### END HIDDEN TESTS
```

The result from Simpson's rule is 0.8556243929705797

## Part 3.5

Compute

$$\int_0^1 e^{-\frac{x^2}{2}} dx$$

with the Gauss-Legendre formula using  $n = 1$ .

In [11]:

(Top)

```
def gauss(
    f,
    n,
    a,
    b
):
    ...
    Parameters
    -----
    f : function
        Vectorized function of a single variable
    n : integer
        Number of points
    a , b : numbers
        Interval of integration [a,b]

    Returns
    -----
    G : float
        Approximation of the integral of f(x) from a to b using the
        Gaussian-Legendre quadrature rule with N points.
    ...
    # ===== 請實做程式 =====
    [x, w] = p_roots(n+1)
    G = 0.5 * (b-a) * sum(w * f(0.5*(b-a)*x+0.5*(b+a)))
    return G
    # =====
```

Run and check your function.

In [12]:

Gauss-Legendre

(Top)

```
G = gauss(f, 1, 0, 1)
print("The result from Gauss-Legendre is", G)
### BEGIN HIDDEN TESTS
assert abs(G - 0.88) <= 1e-1, "Wrong answer!"
### END HIDDEN TESTS
```

The result from Gauss-Legendre is 0.8553145616837845

(Top)

Part 3.6

Compare the obtained results of three methods above and write down your observation. You can use either code or markdown to depict.

$\int_0^1 e^{-\frac{x^2}{2}} dx \approx 0.855624$ , Simpson 比較準
