Lab₃

- 1. 提交作業之前,建議可以先點選上方工具列的Kernel,再選擇Restart & Run All,檢查一下是否程式跑起來都沒有問題,最後記得儲存。
- 2. 請先填上下方的姓名(name)及學號(stduent_id)再開始作答,例如:

```
name = "我的名字"
student id= "B06201000"
```

- 3. 演算法的實作可以參考lab-3 (https://yuanyuyuan.github.io/itcm/lab-3.html), 有任何問題歡迎找助教詢問。
- 4. Deadline: 10/30(Wed.)

In [1]:

```
name = "歐陽秉志"
student id = "B05201012"
```

Exercise 2

It is known that when interpolating a function f(x) with a polynomial p_{m+1} of degree m that using x_j for j=0,1,...,m as interpolation points the error has the form

$$|f(x) - p_{m+1}(x)| = \frac{\left| f^{(m+1)}(\xi_x) \right|}{(m+1)!} \left| \prod_{k=0}^m (x - x_k) \right|,$$

where $\xi_x \in [x_0, x_m]$.

Therefore, the polynomial $\omega_m(t) := \prod_{k=0}^m (t-x_k)$ influences the size of the interpolation error.

1. Put m+1 *distinct equidistant points* in the interval [-1,1], and plot $\omega_m(t)$ for m=5,10,15,20.

Part 0. Import libraries.

```
import matplotlib.pyplot as plt
import numpy as np
```

Part 1. Define $\omega_m(t)$ function.

```
In [3]:
```

In [4]:

```
omega

# Test
print('w_5(0.5) =', omega_m(0.5, np.linspace(-1, 1, 6)))

### BEGIN HIDDEN TESTS
from random import random

rd_number = random()
x = np.linspace(-1, 1, 11)

m = len(x)
product = 1

for i in range(m):
    product *= (rd_number - x[i])

assert omega_m(rd_number, np.linspace(-1, 1, 11)) == product, 'omega_m is wrong!'
### END HIDDEN TESTS
```

 $w_5(0.5) = 0.017325000000000007$

Part 2. Define the equidistant points function.

For example, if m = 4, then m + 1 distinct equidistant points in the interval [-1, 1] should be [-1, -0.5, 0, 0.5, 1].

So the results of equidistant_points(4) will be [-1. -0.5 0. 0.5 1.].

```
In [5]:
```

```
In [6]:
```

```
points

# Test
m = 4
print("Equidistant points:", equidistant_points(m))

### BEGIN HIDDEN TESTS
m = 10
assert np.mean(np.array(equidistant_points(m)) - np.linspace(-1, 1, m+1)) < 1e-7, 'equidistant_points is wrong!'
### END HIDDEN TESTS</pre>
```

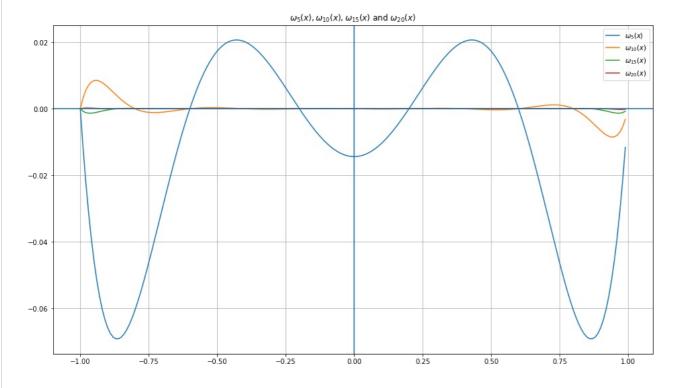

Equidistant points: [-1. -0.5 0. 0.5 1.]

Part 3. plot $\omega_m(t)$ for m = 5, 10, 15, 20.

Please refer parts of plotting in " lagrange.ipynb ".

In [7]:

```
x range = np.arange(-1, 1, 0.01)
fig, ax = plt.subplots(figsize=(16, 9))
# Plot the function w 5(x), w 10(x), w 15(x) and w 20(x)
# Hint: ax.plot( x_points, y_points, color='?', label='?')
# ===== 請實做程式 =====
ax.plot(x\_range, omega\_m(x\_range, equidistant\_points(5)), label="\$\omega\_{5}(x)$")
ax.plot(x\_range, omega\_m(x\_range, equidistant\_points(20)), label="$\omega\_{20}(x)$")
# =========
# Add other text and items
ax.set_title(r's\omega_{5}(x), \omega_{10}(x), \omega_{15}(x)) and \omega_{15}(x)
plt.legend(loc='upper right')
ax.grid(True)
ax.axhline(y=0)
ax.axvline(x=0)
plt.show()
```

Part 4. What's your observation of the above figure?

m越大,函數圖形越逼近x軸

2. Redo " Problem 1. " using *zeros of the Chebyshev polynomial (Chebyshev nodes)* as the interpolation points.

Part 1. Define Chebyshev nodes.

Please refer the part of Chebyshev nodes in " lagrange.ipynb ".

In [8]:

In [9]:

```
chebv_nodes

# Test
m = 5
print("Chebyshev nodes:", chebv_nodes(m))

### BEGIN HIDDEN TESTS
m = 10
assert np.mean(np.array(chebv_nodes(m)) - np.cos(np.linspace(0, np.pi, m+1))) < 1e-7, 'chebv_nodes is wrong!'
### END HIDDEN TESTS</pre>
```

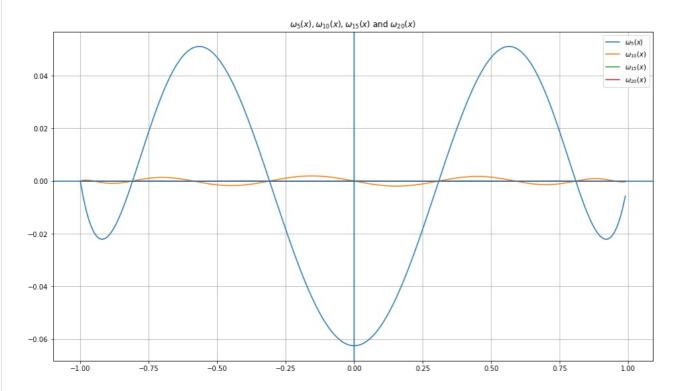

Chebyshev nodes: [-1. -0.80901699 -0.30901699 0.30901699 0.80901699 1.]

Part 2. plot $\omega(t)$ for m = 5, 10, 15, 20.

Please refer parts of plotting in " lagrange.ipynb ".

```
In [10]:
```

```
(Top)
x range = np.arange(-1, 1, 0.01)
fig, ax = plt.subplots(figsize=(16, 9))
# Plot the function w 5(x), w 10(x), w 15(x) and w 20(x)
# Hint: ax.plot( x_points, y_points, color='?', label='?')
# ==== 請實做程式 =====
ax.plot(x_range, omega_m(x_range, chebv_nodes(5)), label="$\omega_{5}(x)$")
ax.plot(x_range, omega_m(x_range, chebv_nodes(10)), label="$\omega_{10}(x)") ax.plot(x_range, omega_m(x_range, chebv_nodes(15)), label="$\omega_{15}(x)") ax.plot(x_range, omega_m(x_range, chebv_nodes(20)), label="\omega_{15}(x)")
# =========
# Add other text and items
ax.set_title(r'\$\omega_{5}(x), \omega_{10}(x), \omega_{15}(x)$ and $\omega_{20}(x)$')
plt.legend(loc='upper right')
\texttt{ax.grid}(\textbf{True})
ax.axhline(y=0)
ax.axvline(x=0)
plt.show()
```

Part 3. What's your observation of the above figure?

n越大越逼近x軸
